# About Policies

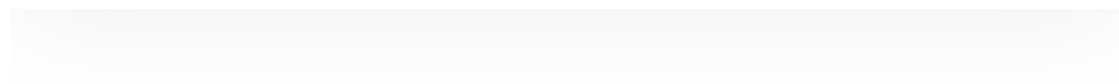

Updated 3 months ago

## Important

*Implementing the correct Policies is critical to protecting your assets.* Policies are your primary security control in your workspace. You must read these guidelines carefully to understand how Policies work before implementing your own.

## Overview

Fireblocks Policies are sets of rules that you define to govern the transactions and other actions initiated within your workspace. Your Policies allow you to control which financial activities are allowed or restricted in your workspace by creating rules across a set of customizable parameters.

The Fireblocks Policy Engine automatically applies your Policies to all transactions created from the Fireblocks Console or Fireblocks API. After a workspace user initiates a transaction, your Policy rules define which actions the Policy Engine will take:

Learn more about the different types of policies and how to create them.

Your Policies govern transfers from your connected third-party main accounts to other destinations, including other exchange, fiat, or vault accounts, Fireblocks P2P Network connections, or whitelisted addresses. Policies do not govern [certain transactions within specific third-party accounts](#).

## Policy types

You can create distinct Policies for each of the following transaction types (also known as categories) shown in the collapsible table below:

### ► Transaction Types

#### Note

Raw Signing, Mint, and Burn are premium features that require an additional purchase. Contact your Customer Success Manager or [complete this form](#) before creating rules for these options.

## Configurable fields by operation type

When creating policy rules in Fireblocks, different operation types support different configurable fields. Use the field descriptions and tables below to understand which fields are available for each transaction type.

### ► Field Descriptions

## Field applicability by operation type

The following tables show which fields apply to each policy operation type:

**Legend:** ✓ = Applies | ✗ = Does not apply | \* = Conditional/Special options

### ► Scope Fields

## ► Action & Special Fields

## Who can manage Policies?

Only your workspace Owner or other Admin-level users can manage Policies. They use the Fireblocks Console to [create and make ongoing changes](#) to your Policies. Your [assigned approval group](#) must approve any proposed Policy changes.

## Policy rules

Policy rules have two components: **Parameters** define which characteristics a transaction must match for the rule to apply (such as who can initiate it, where it goes, and which assets), and **Actions** define what happens next (allow, block, or require approval). Learn more about [How Policies Work](#).

## How the Policy Engine works

The Policy Engine applies rules using the first-match principle by scanning your Policy from top to bottom and applying the first rule that matches the transaction. Because of this, rule order matters; place more restrictive rules before less restrictive ones. Learn more about [How Policies Work](#).

## Default Policies

All newly created workspaces have five default Policy rules already in place. Four of the default rules apply to specific Policy types, while the fifth rule applies to all Policies. Together, these rules allow you to securely complete certain transactions from day one. Default Policies are grayed out and are active only when you don't have any other Policy rules set.

Below are the descriptions of each default rules actions.

### Transfer Policy

- Allow transfers of NFTs to any *whitelisted* address, which includes vault accounts.
- Allow transfers of any USD amount of any asset to any *whitelisted* address, which includes vault accounts.

### Contract Call Policy

- Allow contract call transactions from any wallet on any blockchain to any *whitelisted* smart contract.

### Approve Policy

- Allow [Web3 Approve transactions](#), enabling contract calls to withdraw your funds.

### All Policies

- Block any transaction that is not explicitly allowed by another Policy rule.
  - This rule is the last rule at the bottom of each Policy. Unlike the first four rules above, you can't remove this rule when you create your own Policies.

#### Note

If your operational needs require more functionality from day one, we recommend creating your own Policies before making any transfers. Customizing your Policies immediately deletes the default rules. Deleting your custom Policies reinstates the default rules and their Policies.

## Using user groups in Policy rules

User groups enable you to apply rules to sets of multiple users, simplifying your Policies and reducing the need to revise them as your team changes. Learn more about [User group management and best practices](#).

## Next steps

- [How Policies Work](#) - Learn about the first-match principle and rule ordering
- [Create a Policy Rule](#) - Start building your first Policy rule
