Flare: Introduction

Updated 8 months ago

Fireblocks now supports the Flare network, with FLR as its native token. You can now securely store FLR and transfer it from your Fireblocks wallet, Fireblocks P2P Network connections, and other venues. The supported canary network is “Songbird”.

Flare is an opt-in EVM chain. In order to gain access to it, [submit a ticket](#) to our Customer Support team.

Flare is expected to perform a final airdrop on January 9th, 2023. In case you previously worked with us on enabling this airdrop in your workspace, and had performed the required Ripple transaction, you may be automatically opted-in to this chain. For detailed information see special notes below.

Supported tokens

Since Flare is an EVM blockchain, Fireblocks supports its correlated ERC-20 tokens.

Special notes

1. The FLR assets airdrop is expected to occur on January 9th, 2023. The airdrop is conditioned on having performed a particular transaction on the Ripple blockchain in the year 2020.
2. We executed that transaction using a specific script that required you to sign the transaction. That script was personally tailored to your profile, using your particular **workspaceID** and **vaultID**.
