AML Advanced Configuration settings

Note

The AML integration is a premium feature that requires an additional purchase. Reach out to your Customer Success Manager if you do not have an agreement with an AML provider or you need help enabling the feature.

Overview

You can configure additional Anti-Money Laundering (AML) settings to protect your workspace and ensure uninterrupted operations. These settings apply to your workspace and are not dependent on the AML provider you choose to use.

Bypass screening during service outages (Skip on failure)

By default, this setting is enabled. This helps you avoid AML provider outages by bypassing screening and accepting transactions received during the outage. This also bypasses screening when Fireblocks does not receive a valid screening result before the corresponding transaction delay elapses. In both cases, you can view the bypass reason on the Transaction History page.

When screening is bypassed, outgoing transactions are sent, and incoming transactions are not frozen. Fireblocks continues polling your AML provider for screening results throughout the configured transaction delay period. If the delay expires without results and bypass is enabled, Fireblocks may continue polling in the background until the total polling time reaches 6 hours from when the transaction was registered. During background polling, the transaction has already been processed, but if screening results are received, the screening status is updated. Background polling only occurs if the configured delay is less than 6 hours. [Learn more about polling during delay periods.](#)

Disabling this setting deactivates the bypass, which means that all transactions screened during the outage, and all transactions that do not receive a valid screening result before

By default, this setting is enabled. This allows Admin-level users to unfreeze funds associated with rejected incoming transactions. They can unfreeze the funds using the Console or the API.

Disabling this setting prevents all users from unfreezing funds. You must submit a request to Fireblocks Support to unfreeze funds.

Admins can initiate transactions that bypass policy rules

By default, this setting is enabled. This allows Admin-level users to bypass rejection on outgoing transactions and send them.

Disabling this setting prevents all users from bypassing rejection on outgoing transactions. You must submit a request to Fireblocks Support to bypass the rejection and send the transactions.

Bypass transactions made through the Fireblocks P2P Network

By default, this setting is disabled. This means that all transactions—even those initiated via the Fireblocks P2P Network—will be screened by your AML provider.

Enabling this setting bypasses AML screening for all transactions initiated via the Fireblocks P2P Network.

Inbound transaction delay

By default, the **Inbound Transaction Delay** setting is set to 30 seconds. This means a screened incoming transaction stays locked in a pending state until your AML provider returns a screening result or until 30 seconds elapse. The maximum inbound transaction delay allowed is 7 days.

Understanding active and background polling

During the configured delay period, transactions remain in "pending screening" status while Fireblocks actively polls your AML provider for results (**active polling**). If the delay expires without results and bypass is enabled, the transaction proceeds, but Fireblocks may continue checking for results (**background polling**). If results arrive during background polling, the screening status is updated, but the transaction status does not change.

Active polling continues for your entire configured delay period. If your delay is less than 6 hours and bypass is enabled, background polling continues until 6 hours of total polling time is reached. If your delay is 6 hours or longer, no background polling occurs.

times for the first block. In order to account for this variety, we recommend using a 10-minute inbound transaction delay.

- If you receive a screening result within the defined time period, you can freeze the transaction's funds before they become spendable if necessary. Remember, funds that have been spent or internally transferred cannot be frozen.
- If you do not receive a screening result within the defined time period:
 - And the transaction *bypasses* screening, the transaction's funds automatically release into the destination wallet address. You can then [freeze the funds using the API](#). Remember, funds manually frozen via the API can only be [unfrozen by using the API](#). If your configured delay is less than 6 hours, Fireblocks continues polling in the background until total polling time reaches 6 hours. If screening results are received during background polling, the screening status is updated.
 - And the transaction *doesn't bypass* screening, AML screening ceases and the transaction's funds are frozen.

Outbound transaction delay

By default, the **Outbound Transaction Delay** setting is set to 0 seconds. This means a screened outgoing transaction uses the immediate response from your AML provider before proceeding.

- If you receive a screening result within the defined time period, the transaction is accepted or rejected according to your AML Post-Screening Policy. You can cancel the transaction before it's created if necessary.
- If you do not receive a screening result within the defined time period:
 - And the transaction *bypasses* screening, the transaction is sent. If your configured delay is less than 6 hours, Fireblocks continues polling in the background until total polling time reaches 6 hours. If screening results are received during background polling, the screening status is updated.
 - And the transaction *doesn't bypass* screening, AML screening ceases and the transaction is not sent.

You can change this value to be greater or less than the default setting. The maximum outbound transaction delay allowed is 90 minutes (5400 seconds). If you want to extend this limit, contact [Customer Support](#) to change your JWT lifetime limit.

Advanced Configuration settings. They are:

- **Bypass screening during service outages (Skip on failure):** On
- **Admins can unfreeze transactions frozen by the policy:** On
- **Admins can initiate transactions that bypass policy rules:** On
- **Bypass transactions made through the Fireblocks P2P Network:** Off
- **Inbound transaction delay:** 30 seconds (10 minutes if using Chainalysis V2)
- **Outbound transaction delay:** 0 seconds

This means that your workspace:

- Bypasses transaction screening in the event of an AML provider service outage and when Fireblocks does not receive a valid screening result before the corresponding transaction delay elapses.
- Allows Admin-level users to unfreeze funds for rejected incoming transactions using the Console or Fireblocks API.
- Allows Admin-level users to bypass rejection for outgoing transactions using the Fireblocks Console.
- Screens transactions made through the Fireblocks P2P Network.
- Automatically locks screened incoming transactions until your AML provider returns a result or 30 seconds elapse (10 minutes if using Chainalysis V2).
- Uses the immediate screening response from your AML provider for your outgoing transactions.
