Tokenization best practices

Best practices when assigning token contract roles

Overview

When using the Fireblocks Contracts in Tokenization, you can [assign roles for your token contracts](#). When delegating these roles, such as Default Admin or Minter, you should implement security measures to prevent contract misuse and unauthorized access.

Below is a list of best practices for assigning token contract roles. Since the safest setup can be complex, we've detailed three options for basic, intermediate, and advanced security practices. Ultimately, how you assign roles depends on your business needs.

[Learn more about Policy rules for minting and burning tokens.](#)

Basic (not recommended)

- Use a single workspace for all tokenization actions.
- Assign all roles to a single vault account.
 - For example, assign the Minter, Pauser, and Default Admin roles to a single vault account.
- Create a basic Policy with rules that don't differentiate between tokenization roles.

Intermediate

- Use a single workspace for all tokenization actions.
- Assign each role to a unique vault account.

function.

Advanced

- Use multiple workspaces for your tokenization actions.
 - Separate workspaces based on their use and the risk profile that makes sense for your business context.
 - Example:
 - Place powerful roles, such as Default Admin and Upgrader, in one workspace.
 - Place Minting and Burning roles in another workspace.
- Assign each role to a unique vault account.
- Create granular Policy rules for each role.
 - For example, create a rule where the Minter role can only call the "mint()" function.
