Fireblocks Key Link Overview

Updated 6 months ago

With Fireblocks Key Link, you can integrate your organization's Key Management solution with the platform. This enables you to leverage the following features:

- Robust wallet management capabilities
- Built-in node infrastructure
- Governance engine
- Transfer network
- Automated compliance functionality

You can seamlessly manage assets across hot, warm, and air-gapped cold storage environments from a single platform. Manage your key storage in cloud hardware enclaves or with FIPS-certified hardware security models (HSMs) in the cloud or on-prem.

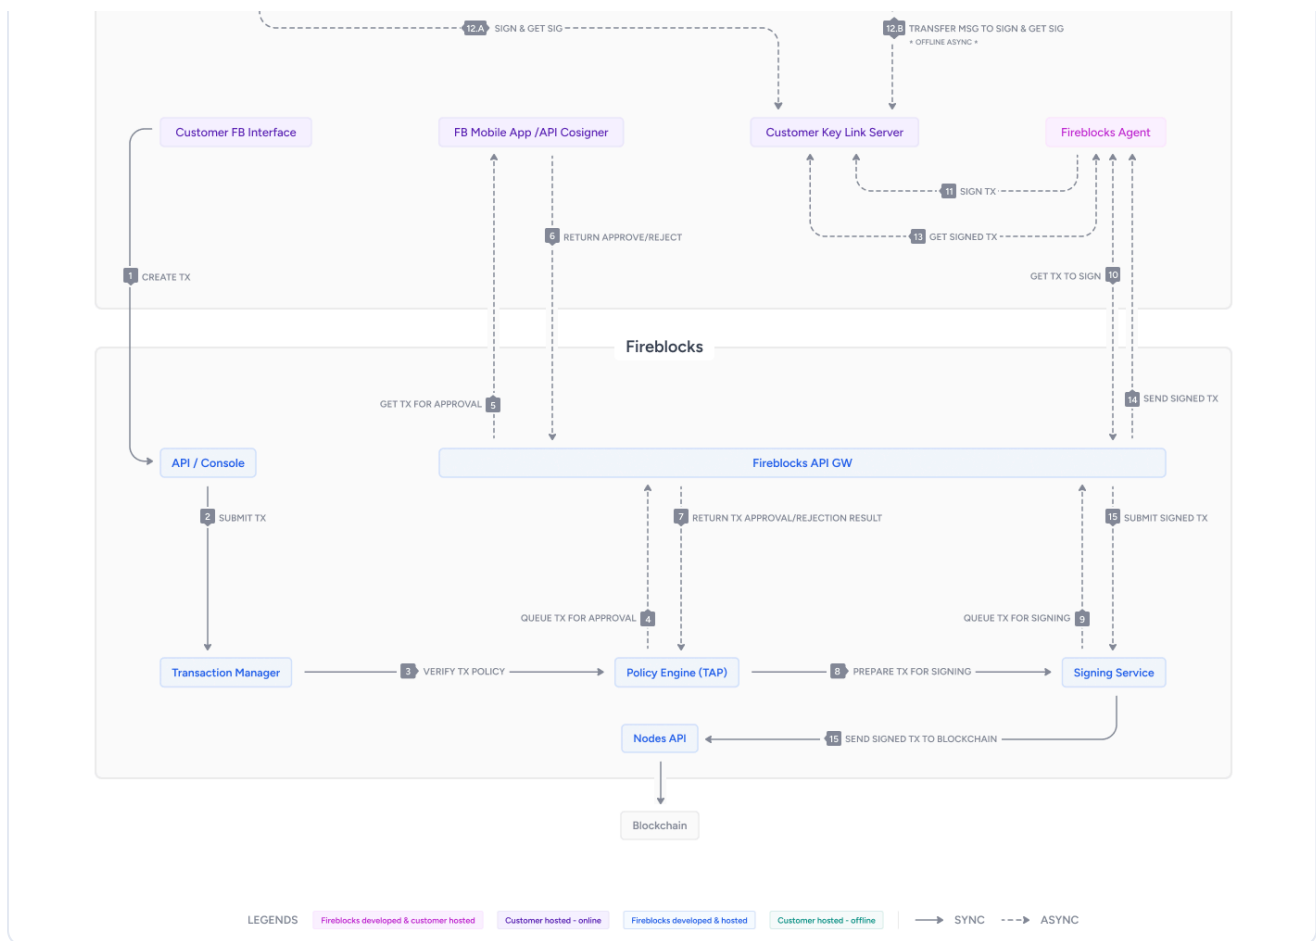

This article assumes your Key Management Infrastructure is based on an HSM. However, we allow the usage of other systems that support this framework.

The Fireblocks Key Link workspace setup differs from the standard Fireblocks MPC-based workspaces by allowing customers to host several key components, as shown in the diagram above.

The following lists describes the components and their responsibilities:

- **Fireblocks Agent:** An open-source repository that needs to be hosted by the customer. It is an on-prem service (Typescript) responsible for retrieving new messages to sign from Fireblocks, relaying these messages to the customer's HSM through the customer's server, and returning the signed results to Fireblocks.
- **Customer Server:** Developed and hosted by the customer. Receives messages to sign from the Fireblocks Agent, signs the messages via the customer's HSM, and relays them back to Fireblocks. The customer server can have any custom logic (e.g., custom on-prem policy, transaction validation, etc.) to approve or reject transaction signing requests.
- **HSM Component:** The actual HSM implementation. Can be on-prem, cloud-based, hot or cold HSM, or a different Key Management System.
