Legacy backup tool

Fireblocks Vault Key Derivation Tool

Overview

The Fireblocks Vault Key Derivation Tool is an open-source tool that inspects a [Hierarchical Deterministic \(HD\) Wallet](#) for any ECDSA-based asset and extracts the derived addresses.

You can use this tool to do the following:

1. Retrieve the extended public key and the derived addresses of a matching account ID based on the extended public key, asset type, and account ID.
2. Retrieve the extended private key and the derived addresses of a matching account ID based on the extended private key, asset type, and account ID.

Using the Vault Key Derivation Tool

1. [Go to our Key Recovery Tool GitHub repo.](#)
2. Find the **fb-hd-derive-v2.7.html** file, then right-click and select **Save Link As**. If you have already downloaded the Fireblocks Key Backup and Recovery tool, the Fireblocks Vault Key Derivation tool is already on your device as part of that folder.
3. Save the file in the appropriate directory on your machine.
4. Open the file, then enter the necessary information in the Derivation Inputs fields to find the vault account's extended private and public keys.

Derivation Inputs

XPRV or XPUB

000...000

Asset

BTC - Bitcoin

Vault Account ID

0

Address type

☒ Permanent Address

☐ Deposit Addresses

Address Format

☐ Legacy (base58)

☒ Bech32 (Segwit)

Account Extended Private Key

Account Extended Public Key

The account extended keys can be used for importing to most BIP44 compatible wallets, such as mycelium or electrum.

The BIP32 derivation path and extended keys are the basis for the derived addresses.

Sandbox and Testnet Workspace Exceptions

There are specific points to note regarding Sandbox and Testnet Workspaces. Go [here](#) for more information.
