Policy export

Updated 18 days ago

The **Policy Export** feature allows administrators to download an offline copy of the workspace's Policy. Whether you require a high-level summary for internal compliance, or a granular technical breakdown for a security audit, this tool ensures your policy configuration is accessible and portable outside the Fireblocks Console.

Export formats

You can choose between two formats based on your specific requirements:

- **CSV (high-level summary):** Optimized for general audits and human review. This file mirrors the Rule Management table in the Console, providing a summary of rules, actions (Allow, Deny, or 2-step approval), and conditions, including specialized parameters such as *Amount over Time* (e.g., "\$5 in 2 hours").
- **JSON (technical detail):** Optimized for technical deep-dives or programmatic analysis. This format includes the full policy hierarchy and resolves all internal Object IDs (Vault accounts, User Groups, and Assets) into human-readable names.

How to export your policy

To initiate an export, follow these steps:

1. In the Fireblocks Console, navigate to the Policy menu.
2. Select the **Export** button located at the top of the **Policy Overview** screen.
3. In the configuration drawer, select your desired Format (CSV or JSON).
4. Select the specific Policy Types you wish to include in the export.
5. Select **Generate Export**.

Note:

For security and performance reasons, Fireblocks generates an archive and sends a secure download link directly to your registered email address.

Security and permissions

User roles

The Policy Export feature is restricted to users with elevated permissions. The following roles can initiate an export:

- Owner/Admin
- Non-signing Admin
- Security Admin
- Security Auditor

Audit trail & versioning

- **Logging:** Every export request is logged in the Fireblocks Audit Trail. This log includes the identity of the requester, the export type, and the timestamp.
- **Data Integrity:** Both export formats include the specific policy version and generation date to ensure the data is mapped to a specific point in time.

Best practices

- **For stakeholders:** Use the CSV format for internal presentations or non-technical compliance reviews.
- **For backups:** Use the JSON format for full security posture backups or when importing data into third-party security information and event management (SIEM) tools.
