Policy for Cold Wallet

Updated 5 months ago

Note

Creating a Fireblocks Cold Wallet workspace requires scheduling onboarding time. For more information contact your [Customer Success Manager](#).

Overview

You must submit a separate [Policy template](#) for your Cold Wallet workspace. In a Cold Wallet workspace, your Policy rules are slightly different than in an online signing workspace:

- You can add a single user, multiple users, user groups, or a combination to the **Designated Signer** column allowing them to sign Cold Wallet transactions. You must assign each user a **Signer** role, whether you add them individually or in a user group.
- You *cannot* add the workspace Owner to the **Designated Signers** column, either individually or in a user group. Owners cannot sign transactions in Cold Wallet workspaces.
- You *cannot* add API users to the **Designated Signers** column. Signers must use the Fireblocks Cold Wallet mobile app to complete the signature process manually. However, you can add API users as Non-Signing Admins if you want them to serve as API co-signers that automatically approve workspace operations.
- You *cannot* add multiple users or a user group to the **Designated Signers** column for rules with an exchange account or fiat account as the **Source**. Transfers matching the rule would fail automatically.

After you complete the template, submit it to [Fireblocks Support](#) for approval and implementation.

also create semi-automated transaction flows where any group member can sign transactions initiated via API.

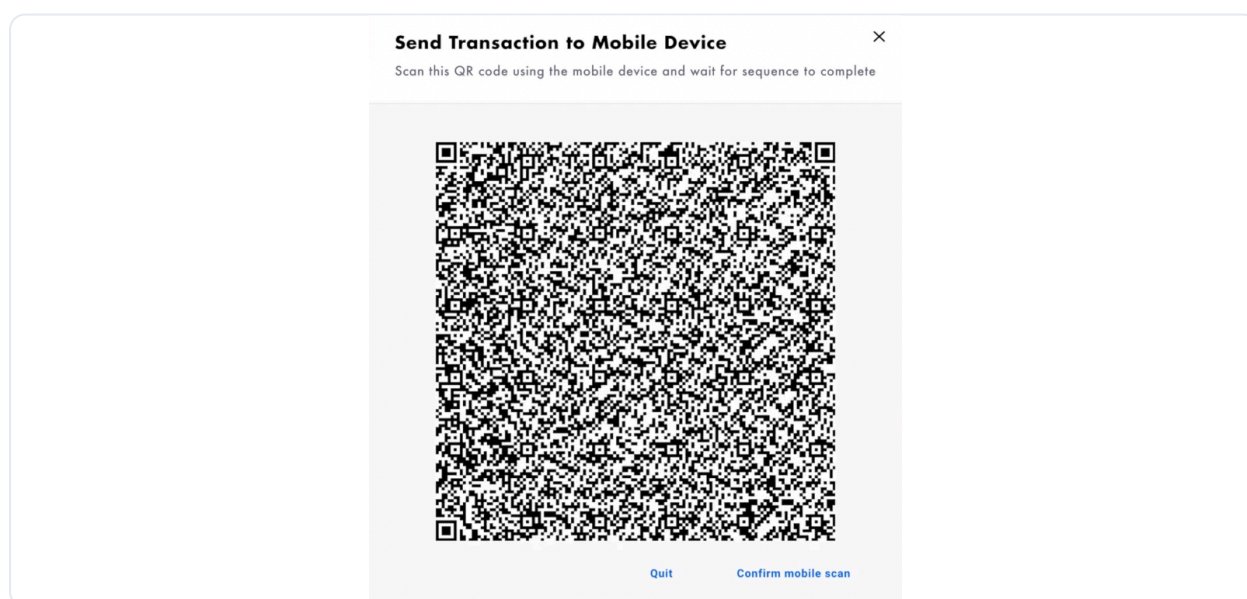

How does a group of designated signers work?

Only one person in the group of designated signers can sign a transaction at a time. However, there are a few differences between designated signer groups and individuals:

- When a user submits an offline signing transaction, the transaction card appears in each designated signer's **Offline Signing** panel, so any of them can initiate signing.

- When they select **Sign** on a transaction card, the **Send Transaction to Mobile Device** window opens, where they scan a QR code. The card disappears for other signers. The window may take a few seconds to open. Do not close or refresh the tab or you will be sent back to the **Offline Signing** panel, where you must select **Sign** again to reopen it.

- If the signer who initiated offline signing does not finish the process in a reasonable amount of time, the user can cancel and re-submit the transaction so a different

Examples: Policy rules with a designated signer group

Companies use inclusionary or exclusionary rules to customize their Policies. This allows multiple ways to ensure transactions match the correct rule. This is important since you *cannot* add multiple users or a user group to the **Designated Signers** column for rules with exchange accounts or fiat accounts in the **Source** column. Transfers matching the rule would fail automatically.

Method 1: Use a group of designated signers only for supported sources

#	Name	Initiator	Signer	Source	Destination	Amount	Asset	Action
01	Transfer to Any w/ no limit	Anyone	Group 1	Any vault account	Any	Unlimited USD per transaction	All	Allow
02	Transfer Any w/ no limit - Approver User A	Anyone	Initiator	Any	Any	Unlimited USD per transaction	All	Require approval of: 1 of 1 user

The rules in the table above state:

- **Rule 1:** This rule allows any transaction from any vault account to any whitelisted destination or one-time address greater than \$0 of any asset. One member of Group 1 must sign all transactions that match this rule.
- **Rule 2:** This rule allows any transaction from any source to any whitelisted destination or one-time address greater than \$0 of any asset. User A must approve all transactions that match this rule.

Therefore, based on the first-match principle, the group of designated signers only signs single transactions if the source is a vault account. User A must approve all transactions from other sources.

Method 2: Excluding a group of designated signers from unsupported sources

#	Name	Initiator	Signer	Source	Destination	Amount	Asset	Action
01	Transfer to Any w/ no limit	Anyone	Initiator	Any vault account	Any	Unlimited USD per transaction	All	Require approval of: 1 of 1 user
02	Transfer Any Fiat Account	Anyone	Initiator	Any fiat account	Any	Unlimited USD per transaction	All	Require approval of: 1 of 1 user
03	Transfer Any w/ no limit - Approver User A	Anyone	Admins	Any	Any	Unlimited USD per transaction	All	Require approval of: 1 of 1 user

The rules in the table above state:

Don't see what you're looking for? Log in for the full Help Center experience

...ation of the time delay greater than 10 days, which will require approval of all transactions that match this rule and a member from Group 1 must sign them.

Therefore, based on the first-match principle, the group of designated signers only signs transactions if the source is not an exchange account or a fiat account.
