Policy rule examples for On/Off-ramp orders

Updated 2 months ago

Overview

This article describes templates for creating Policy rules for Orders that allow you to control your organization's security needs. The examples below include templates for allowing transfers from external bank accounts to providers, between providers and your workspace, and from providers to third parties.

Getting started

Begin by creating a [Policy rule as described here](#), and select **Orders** for the policy type. Once you've created an Order Policy, it will appear in your policies. Select **Edit policy**, then **+Add rule** to create new rules similar to the examples below.

You may choose to create multiple rules that apply to the same scope but different funds. For example, you can create one rule that allows specific users in your workspace to create and sign fiat orders below \$10,000, and a separate rule that requires approval from multiple users for fiat orders above \$10,000.

Order-specific parameters

Scope

- **Connected account:** The account(s) that must be included in the order for the rule to apply. The connected account executes the order.
- **Source - external account:** Selecting an external account as a source allows transfers from fiat bank accounts to the selected provider. Transfers from external accounts are initiated and managed outside of your Fireblocks workspace.

Funds

quote asset.

- **Any:** The rule will apply to buying or selling the base asset in exchange for the quote asset.
- **Base asset:** The asset you are buying or selling that must be included in the order for the rule to apply. This is always an exact amount you set per transaction. Select the minimum and maximum amounts of the base assets that must be met for the rule to apply.
- **Quote asset:** The asset you pay with or receive that must be included in the order for the rule to apply. The amount of this asset is set by the provider at the time of the transaction. Select the minimum and maximum amounts of the quote assets that must be met for the rule to apply.

Examples

The following examples describe parameters for the Scope and Funds of a Policy rule. Set the Action to **Allow** for all examples, and select user(s) to approve and sign the transaction according to your workspace needs.

Onramp - DvP

This example rule allows DvP orders from fiat currencies to digital assets. In this scenario, payment can be made using an external bank account to any connected provider account in your workspace, and the assets can be transferred to a specific destination in your workspace.

and select the intended asset(s), or exchange account(s), and sign them in less common.

Funds

- **Base asset:** Select at least one fiat asset such as **USD**, **MXN**, or **EUR**.
- **Quote asset:** Select **Any asset** or specific assets such as **USDC** or **USDT**.

Offramp - DvP

This example rule allows DvP orders from digital assets to fiat currencies. In this scenario, a transfer can be initiated from your workspace, and the assets or fiat currency can be transferred to a whitelisted wallet or external destination.

Note

If you've used Uniswap in your Fireblocks workspace, you likely have Policy rules with Uniswap addresses as whitelisted destinations. You may want to replace those rules using a predefined list of destinations. [Learn how transaction types are used during swaps.](#)

Convert - prefunded

This rule allows orders between digital assets and fiat currencies. In this scenario, assets held in a provider account can be used to purchase a different digital asset or fiat currency. The assets can remain in the provider account, or you can choose to allow them to be transferred to specific destinations.

Scope

- **Connected account:** Select **any connected account**, or select a specific connected account.
- **Source:** Select **any connected account**, or select a specific connected account.
- **Destination:** Select **any connected account**, or select a specific connected account.

Funds

- **Base asset:** Select the asset that will be sent from the source account, such as **BTC** or **USDC**.
- **Quote asset:** Select the asset that will be sent to the destination account, such as **ETH** or **USDT**.
