Policy rules for Solana program calls

Updated 1 month ago

Overview

To enable native Solana program calls via API, you must [create a new Policy rule](#) with the **Program Call** operation type. You can use the following rule parameters to govern your native Solana program calls: **Source, Initiator, Designated signer, Allow/Block/Request approval**. Additionally, you can whitelist specific programs and addresses to ensure that only approved program calls are executed.

Note

Policy rules for Solana Raw Signing transactions do not apply to Solana program calls initiated via the Fireblocks API.

Whitelisting programs and destinations

For Solana program calls to work as expected, every program you interact with must be explicitly whitelisted, along with any transfer destinations involved in the transaction.

For example, if you're swapping SOL on a DEX like Jupiter, and the transaction routes through wrapped SOL (wSOL), you must whitelist both the wSOL program and the relevant Jupiter program(s) addresses. Without this, the transaction may fail due to missing permissions.

To whitelist specific programs, use the **Contract Wallet** to add a **Program Address**. Choose SOL/SOL_TEST as the blockchain's base asset and add the program address. The new added program should be **Pending Approval** and can be used once approved.

Fireblocks automatically whitelists certain Solana programs and accounts, removing the need for manual whitelisting.

Program	Address	Purpose
System Program	11111111111111111111111111111111	Responsible for creating and managing accounts, transferring
