Adding EVM assets to a workspace

Updated 1 year ago

Overview

Fireblocks supports Ethereum Virtual Machine (EVM) assets across all Fireblocks workspaces. In addition to these globally supported assets, Owners, Admins, Non-Signing Admins, Signers, and Editors can manually add more EVM assets to your organization's workspace as needed.

What standards are supported?

Originally [defined for the Ethereum blockchain](#), the ERC-20 token standard provides a standard interface to implement transferable tokens within smart contracts. ERC-20 is used on EVM blockchains such as Arbitrum C-Chain (ARC-20), Binance Smart Chain (BEP-20), Polygon (MRC-20), and all other EVM blockchain networks supported by Fireblocks.

Fireblocks also supports token formats that adhere to the ERC-20 standard, including ERC-1400 and ERC-1404. You can view a list of all the supported EVM blockchains when you add a new ERC-20 asset to a workspace.

How to add EVM assets to a workspace

There are three ways to add EVM assets to your workspace:

- Via the Fireblocks Console
- Via the Fireblocks API
- Via Contract Calls

Via the Fireblocks Console

1. Go to the Assets page and search for the asset in the top left corner. If the asset is not listed, select **List asset**. This button also appears when attempting to create a

 Fireblocks Help Center

displays the asset's properties.

5. Select **List asset** to list the asset in your workspace. You can now add asset wallets for this asset to any vault account.

Via the Fireblocks API

Use the [Register an asset](#) endpoint to add ERC-20 assets. This makes the asset available via the Fireblocks API for all asset-related operations, such as:

- Creating asset wallets for this asset in any vault account
- Whitelisting addresses for this asset in any whitelisted wallet
- Creating transactions with this asset
- Tracking active transactions with this asset
- Viewing previous transactions with this asset
- Retrieving vault accounts, exchange accounts, and whitelisted wallets that contain this asset.

Via Contract Calls

workspace.

Fireblocks considers ERC-20 assets unverified and insecure when automatically listed in a workspace. An Admin-level user must approve the asset before it can be used in the workspace.

To approve or reject a new ERC-20 asset:

1. In the Fireblocks Console, hover your pointer over the unverified asset.
2. On the pop-up window, select **Approve token** to list the asset in your workspace. Otherwise, select **Contact Support** to request the asset be removed from your workspace.

Additionally, the Owner or Admin can view the asset contract if necessary by selecting View Token Contract.

Finding newly added assets

To find the new asset's ID using the Console, hover over the asset's name to view additional details, including the asset's ID in the Fireblocks API and its contract address. Use the asset's ID in Fireblocks for all relevant API endpoints.

To find the new asset via the API, use the [Get supported assets](#) endpoint, then look for the asset by **name**, **contractAddress**, or **id**.

Troubleshooting

Incoming transactions involving assets deposited to your vault account before being added to your workspace do not appear in your Transaction History. However, the destination account balance will include the asset.

[Contact Fireblocks Support](#) to re-scan the deposit address and recognize the incoming transaction.
