Managing Cardano accounts with Fireblocks using Raw Signing

Updated 1 month ago

Overview

Fireblocks does not currently support Cardano Native Tokens (CNT) natively. This guide outlines a dedicated solution for managing CNT operations with Fireblocks, utilizing our Raw Signing capability alongside a purpose-built SDK and desktop application.

This solution abstracts the complexity of CNT operations, allowing developers and users to effortlessly initiate tokens transfers, monitor balances, manage staking operations, and track transaction history with minimal implementation overhead.

Before you begin

- To use either the SDK or the desktop app solution, you must have Raw Signing enabled in your Fireblocks workspace. Note that Raw Signing has limited Policy capabilities, so be sure to take all required security measures to reduce your risk. Please contact your Customer Success Manager for more information about Raw Signing and security best practices.
- These SDK and application solutions do *not* support ADA operations. Use the Fireblocks Console to manage your ADA.

Our solutions

The Fireblocks solution offers two options for interacting with the Cardano blockchain, using Iagon API. Both options share the same prerequisites and infrastructure, and the Desktop UI interacts with the same SDK backend, supporting identical features.

/

- Iagon API key (required for balance queries, transaction history, and CNT operations). Contact fireblocks to get one

Option 1: SDK with REST API

The Cardano Raw SDK can be used in two ways: directly as a TypeScript library by initializing it and calling its methods programmatically, or as a REST API by interacting with the provided HTTP endpoints, offering flexibility for both integrated and service-based use cases.

The Cardano-Fireblocks SDK enables developers to:

- Fetch the Cardano account addresses for a Fireblocks vault account.
- Retrieve Cardano account balances for both ADA and Cardano Native Tokens (CNT).
- Get detailed information on all tokens owned by the account.
- Create CNT transactions on Cardano. The SDK builds the transaction, sends it for signing in your Fireblocks account, and submits it to the blockchain automatically.
- Support both vault-to-address and vault-to-vault CNT transfers.
- Retrieve detailed transaction history for all transactions sent and received by the account.
- Manage the complete Cardano staking lifecycle:
 - Register and deregister staking credentials
 - Delegate ADA to stake pools
 - Delegate voting power to Delegated Representatives (DReps) for Cardano governance
 - Withdraw staking rewards
- Enrich Fireblocks webhooks with Cardano transaction data (inputs, outputs, UTXOs).

Option 2: Desktop UI Application

Recommended for non-technical users, this Electron-based local application provides an intuitive interface to:

- Set up Fireblocks API credentials securely with guided CSR generation
- View vault accounts with Cardano addresses and CNT balances
- Create and sign CNT transactions (vault-to-address or vault-to-vault)
- Monitor transaction history
- Manage complete Cardano staking lifecycle through dedicated modals
- View staking information, delegation status, and rewards

Installation & Setup

1. Enable Raw Signing
2. Configure the Policy
3. SDK setup
4. Using the desktop app
