Proof of Assets

Updated 1 year ago

Overview

Proof of Assets provides a verifiable way of proving your control of the digital assets held in your Fireblocks workspace(s) to external parties, such as auditors, lenders, investors, and customers.

Each Fireblocks workspace has a Vault that can have multiple vault accounts, and each vault account can host numerous asset wallets, each with its own balance, across a range of supported blockchains.

Providing Proof of Assets

To gather all the necessary information for Proof of Assets:

1. [Retrieve your wallet addresses](#)
2. [Aggregate the wallet balances](#)
3. [Prove you control a wallet address](#)

You can provide a Proof of Assets for the wallet addresses within your Fireblocks Vault with List of Wallet Addresses and Balances (verifiable on the blockchain) + Proof of control of each of those Wallet Addresses = Proof of Assets.

Retrieving Wallet Addresses

Retrieve a list of all wallet addresses in a workspace by using one of the following methods.

Fireblocks Console

Don't see what you're looking for? Log in for the full Help Center experience

 Fireblocks Help Center

/

API Query

Retrieve all addresses held in a workspace by using one of the following:

- The [Get vault accounts \(Paginated\)](#) endpoint returns a list of vault accounts and shows the total asset balance of each vault account
- The [Get vault wallets \(Paginated\)](#) endpoint returns a list of the asset wallets within each vault account and the individual balance of each wallet

Manual Compilation

We do not recommend this method because of how intensive the effort is. Still, you can create a list of all the wallets in your Fireblocks workspaces by going into each Vault and copying the wallet addresses per each blockchain's base asset. You may also view the balance of each vault at a segmented or aggregated level.

The screenshot shows the 'My Vault' interface for a vault named 'YCVault'. It features a search bar labeled 'Asset or Address'. Below the search bar is a table listing assets and their balances. The table has three columns: an icon for the asset, the asset name and type, and the balance in both the asset's native unit and USD.

Asset Icon	Asset Name	Balance (Native Unit)	Balance (USD)
	ETH_TEST4 Ethereum Test (Rinkeby)	0.003944	\$4.47
	ALGO_TEST Algorand Test	5.431212	\$1.36
	ETH_TEST3 Ethereum Test (Goerli)	0.000399	\$0.45
	XLM Stellar	1	\$0.09
	XLM_TEST Stellar Test	1	\$0.09

Aggregating the Balances

Depending on how you retrieved the wallet addresses, aggregate their balance using one of these methods. Regardless of the method, however, a third party can take the exported wallet address list and verify all balances by using public blockchain explorers.

Sum up using exported balances

Sum up asset balances retrieved via the API

Sum up the asset balances returned when you used the [Get vault accounts \(Paginated\)](#) or [Get vault wallets \(Paginated\)](#) endpoints.

Manually compiling asset balances

We do not recommend this method because of how intensive the effort is. Still, you can use the Console's Assets page to create a list of asset balances in the workspace by going through each asset you hold and summing up the balances from that list.

Proving you control a wallet address

The final step is to prove you control a wallet address by signing a message from that wallet address. The message should be provided by the counterparty you are providing the Proof of Assets to and post-signing you should share the Signature Hash with them. They can verify the signature using the wallet address, message, and signature hash; and thus, your control of the wallet.

You may do this off-chain by using one of the following methods.

 Fireblocks Help Center

/

Typed Message Signing

Similar to Raw Signing, [Typed Message Signing](#) lets you sign messages using specific standard formats that prefix the message with a magic string. This makes the feature safer but only useful for [certain use cases](#).

This method also requires access to the Fireblocks API. Visit our Developer Portal to learn [how to structure the Typed Message API call](#).

A third-party service or publicly available tool

You can sign a third-party service's message to prove you control a wallet. You can connect to third-party services using WalletConnect or the Fireblocks Browser Extension. Or you can directly connect to third-party services such as [Etherscan](#).

As always, we recommend performing due diligence and only using reliable, low-risk services.

FAQ

How can an external party confirm my signature hash?

Once you sign a message from the external party, they can verify the signature hash you shared using one of the publicly available tools, such as [Verified Signatures](#) from Etherscan, or develop their own tools. This process might vary by blockchain.

Is Proof of Assets the same as Proof of Reserves or Proof of Solvency?

Proof of Assets is a verifiable way for you to prove that you control the wallet addresses within your Fireblocks workspace(s), and in turn, the digital assets in these wallet addresses.

Proof of Reserves or Solvency requires including a view of the entity's liabilities, such that $\text{Proof of Reserves or Solvency} = \text{Proof of Assets} + \text{Proof of Liabilities}$, where Liabilities is equal to or less than Assets. Proof of Reserves or Solvency is not discussed in this article.
