Sending fiat transfers

Updated 8 months ago

Fiat funds can be sent to counterparties seamlessly with Fireblocks, similar to transferring any other digital asset.

Transferring fiat funds to a counterparty

Network connections

You can easily transfer funds through the [Fireblocks P2P Network](#) if your counterparty has a fiat account of the same bank and currency connected to their Fireblocks workspace.

Exchanges

We are currently working on adding support for integrated fiat transfers for [some exchange connections](#) via BLINC, such as Bitstamp, Coinbase Pro, HTX, Kraken (and Kraken International). At the moment, transfers to all exchanges can be made using address whitelisting, as described below.

Withdrawing fiat

Sending fiat from the console

To send funds to a counterparty from the console, you can [withdraw](#) or [create a new transfer](#) as with any other new transaction.

Sending fiat via the API

To send fiat via the API, first whitelist a new account number by [adding the account number to an Internal Wallet \(My Wallet\)](#) or an [External Wallet](#).

Note

The account number must be passed in the address field and the (optional) transfer description in the tag field.

To transfer funds, call the [Create a New Transaction](#) endpoint.
