# Solana Tokenization

Fireblocks provides support for tokenization on the Solana blockchain. You can issue Token-2022 tokens or link any Token-2022 or SPL tokens from the Solana ecosystem to your workspace.

The Token-2022 tokens consists of these features:

- **Metadata:** Attach and update metadata for enhanced token utility
- **Transfer hook:** Execute custom logic with each token transfer
- **Metadata pointer:** Reference external metadata sources for flexible token attributes
- **Interest bearing:** Allow tokens to accrue interest over time
- **Pausable:** Indicates that the account belongs to a pausable mint
- **Default Account State:** Sets a default state for all new token accounts created for a mint
- **Mint close authority:** Securely close the mint account
- **Transfer fee config:** Apply dynamic transfer fees for token movement
- **Permanent delegate:** Assign a permanent delegate for advanced token management

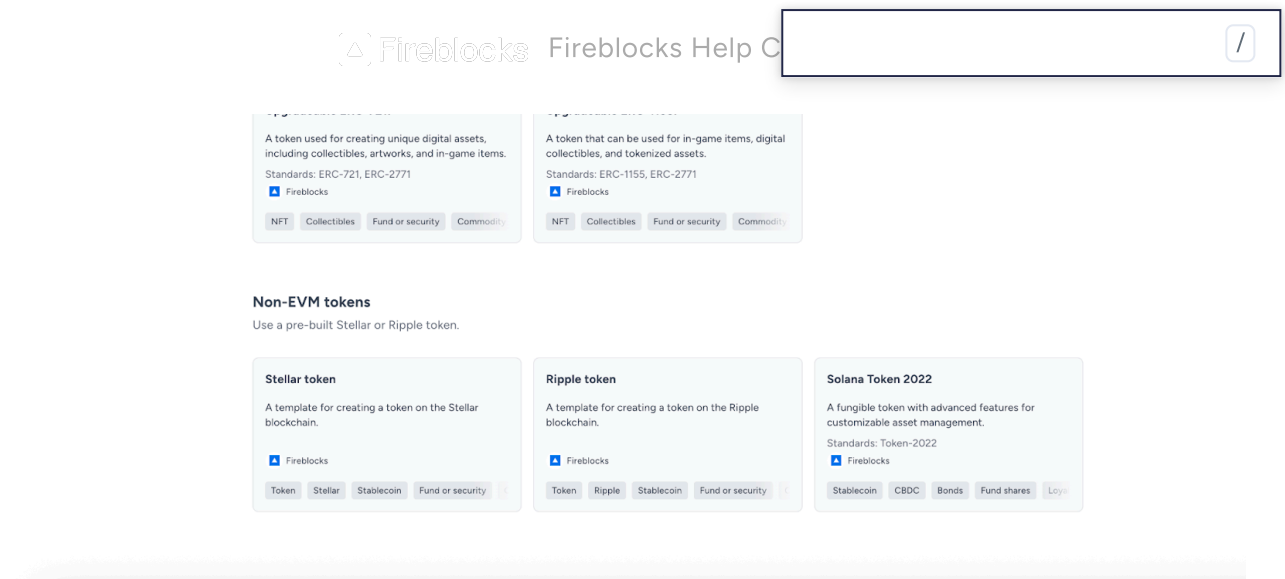

To learn more about these Token Extensions, visit the [Solana extension guide](#).

## Issuing Token-2022 tokens from Fireblocks Tokenization engine

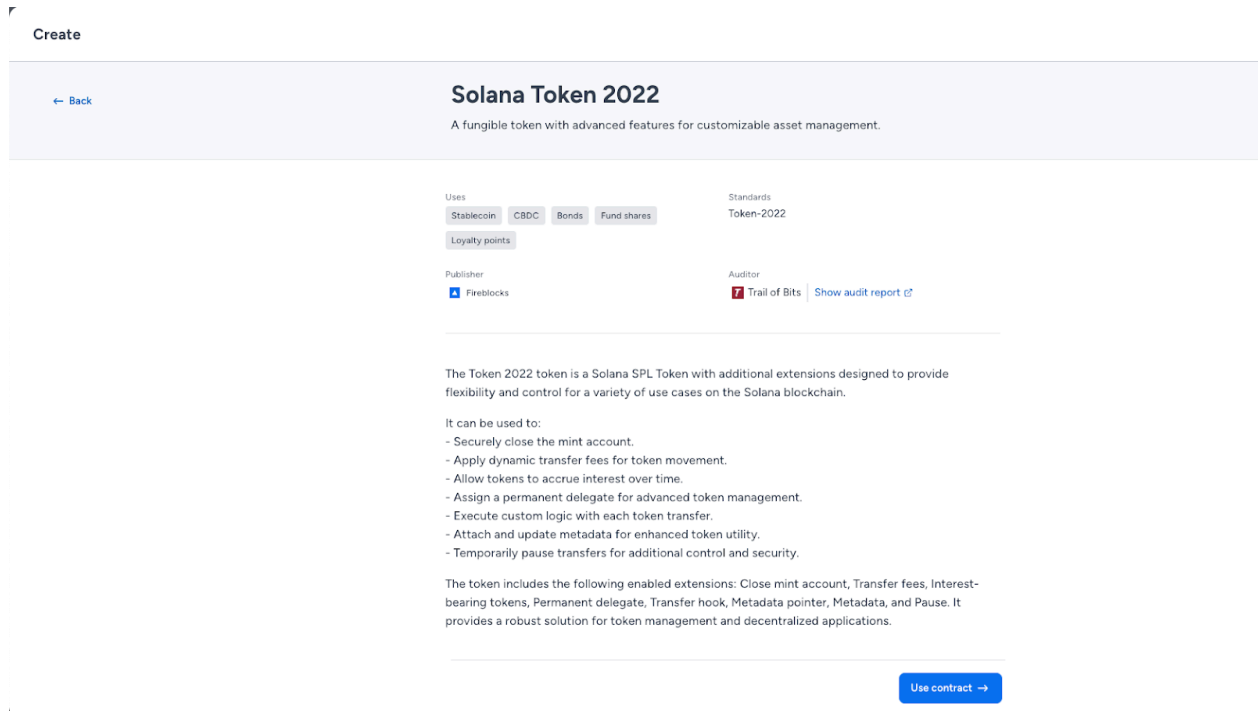

To issue these tokens:

1. Navigate to the **Tokenization** page inside your workspace. Select the **+Create** button to start a new deployment. You will see a list of available contracts for deployment. Scroll to the very bottom, where *Solana Token 2022* is listed under

Don't see what you're looking for? Log in for the full Help Center experience

2. You will then see the token info. Select **Use Contract** to proceed.

The screenshot shows a workspace titled 'Blockchain: Solana Devnet'. It contains a table with token details:

| Blockchain: Solana Devnet |              |
|---------------------------|--------------|
| Name                      | Solana Token |
| Symbol                    | SOT          |
| Decimals                  | 9            |
| Issuer vault account      | Default      |

Once you sign the transaction and it is confirmed on-chain, you are able to see the linked token in your workspace.

## Common issues

- **Policy:** Make sure your policy allows interacting with Solana program calls
- **Vault Account:** Your workspace should have at least one vault account with a Solana asset wallet that is funded with gas tokens. Once you create a wallet, you will be prompted to perform an on-chain operation to create a wallet. Make sure that step is completed before sending transactions.

## Additional remarks

### Authorities granted to the deployer at deployment

The following authorities are granted to the issuer of the token at the time of deployment:

- Metadata Pointer Authority
- Mint Authority
- Transfer Hook
- Freeze Authority
- Rate Authority
- Transfer Fee Config Authority
- Withdraw Withheld Authority
- Close Authority
- Permanent Delegate

This is done because Solana requires a signature from each address receiving the authority, and Tokenization does not support Multiple signatures in one transaction.

Fireblocks Help Center

Some functions, like **setAuthority**, which require multiple signatures, are not supported for now due to tokenization lacking support for multi signature requests.

## Interest-bearing account balances

Another limitation is that balances for interest-bearing accounts may not be displayed correctly, so use with caution.
