Fireblocks API

The Fireblocks API

Overview

Fireblocks offers a robust and easy-to-integrate REST API and webhooks that allow you to interact programmatically with the Fireblocks platform to automate your workflows, provision wallets rapidly, and receive automated notifications about workspace events.

To simplify your setup and experience, we offer [Python](#) and [JavaScript](#) SDKs and a comprehensive [Developer Portal](#) with API documentation, SDK quickstarts, and use case development guides. The Developer Portal is your one-stop shop to build exciting new applications or integrate Fireblocks with your existing apps to add new capabilities.

What can I do with Fireblocks API?

Automate workspace management workflows

Programmatically manage your workspace with API endpoints for vaults, assets, wallets, third-party accounts, Fireblocks P2P Network, and user management actions.

Automate transaction workflows

Program and automate the transfer of assets at the retail scale, rebalance between exchanges based on your trading strategies and automatically sign transactions with a secure API Co-Signer.

Scale wallet and address creation

Rapidly and cost-efficiently provision multiple wallets and view and create deposit addresses and exchange accounts. Whether you are a Game studio, provide NFT services, or offer a dApp - you can build native wallets into your products, allowing users to self-custody their digital assets.

Securely develop and operate smart contracts

Use Fireblocks' industry-leading security layers for granular, role-based access controls to manage which developers can deploy smart contracts, perform upgrades, or call sensitive smart contracts operations, such as pausing or updating contract data.

Automate DeFi and NFT access and transfers

Fireblocks smart contract APIs, Web3 Provider, and Web3-native plugins allow you to initiate transactions that interact directly with smart contracts on Ethereum Virtual Machine (EVM) compatible networks.

Sign any transaction type and message

Generate any ECDSA and EdDSA transactions with “raw signing” or sign Ethereum personal messages and EIP712 structure data messages with “typed message signing.”

Fireblocks SDKs and Web3 tools

Fireblocks offers various SDKs to help with your development:

- Language-specific SDKs for the Fireblocks API
 - [Javascript](#)
 - [Python](#)
- Web3 tools
 - [Fireblocks Web3 provider \(EIP-1193 compatible\)](#)
 - [Fireblocks Hardhat plugin](#)

The Fireblocks Development Portal includes [detailed guides on how to use each SDK and tool](#).
