About the Fireblocks mobile app

Updated 3 years ago

The Fireblocks mobile app is a key component of your secure transaction approval and MPC-CMP signing workflows, as well as key workspace governance actions. The app has two primary purposes:

- It is where your workspace users who are authorized to sign and approve transactions complete these actions on their mobile devices.
- The app holds a cryptographic MPC key share in the secure enclave of each authorized user's device, which enables the device to be used for transaction signing.

Authorized users sign or approve transactions on [compatible iOS or Android devices](#). Your workspace Owner and Admins also use it to approve workspace configuration changes, whitelisting of addresses, and external workspace connections for your workspace.

During the authorized user's initial setup, your workspace Owner approves and generates an MPC-CMP key share that is then stored in a secure enclave of their compatible mobile device. [Read this article for more specific details about approving using your Fireblocks mobile app.](#)

Important

Since signing devices hold cryptographic MPC key shares in secure enclaves, the Fireblocks mobile app has hardware-encrypted data that does not upload itself to iCloud or Google Cloud.

This is unique compared to your other phone apps. Therefore, you cannot do three things with the Fireblocks mobile app that you can with other apps:

- Restore from iCloud
- Uninstall, then re-install and connect to a workspace without assistance from your workspace Owner or Fireblocks Support
- Add another biometric ID to your device, re-open the app, and continue to sign with it.

This is why you should never uninstall your Fireblocks mobile app unless explicitly instructed to by Fireblocks Support. Doing so removes your signing key. Unless you are a
