Allowlist IP addresses for API user requests

Updated 2 days ago

Allowlisting IP addresses restricts an API user's API calls to specific addresses you trust. Fireblocks recommends allowlisting IP addresses for all API users in your workspace. Without allowlisting, a stolen API key can be used from any machine on the internet. Only workspace Owners can allowlist IP addresses for an API user.

Allowlisting accepts only /32 CIDR notation. IP ranges are not supported.

To allowlist IP addresses for an API user:

1. In the Fireblocks Console, go to [Developer Center > API users](#).
2. Find the API user, then select the more actions menu (:) > **Allowlist IP address**.
3. Add or remove IP addresses, separating multiple addresses with commas.
4. Select **Save**.
