Batch approvals & signing

Updated 1 month ago

Overview

Batch Approvals & Signing allows you to process multiple transfer requests simultaneously from your Fireblocks mobile app. Instead of approving or signing transactions one at a time, you can select up to 10 requests and process them together with a single authentication. All transfers in your batch are processed in parallel, significantly reducing the total time compared to processing them individually.

All transfers in your batch are processed in parallel, significantly reducing the total time compared to processing them individually.

Batch Approvals (v3.4.0 or later): the foundational batch feature, which enables batching for pre-signature approval requests and unlocks the entire batch capability for your workspace. You must enable Batch Approvals before you can use Batch Signing.

Batch Signing (v3.5.0 or later): extends your batch to also include signing-stage transfer requests. Requires Batch Approvals to be enabled first. Once enabled, you can create approval-only batches, signing-only batches, or mix both in a single batch.

Key benefits:

- Process multiple requests with one PIN and biometric authentication
- Reduce time spent on repetitive signing
- Maintain security with built-in safeguards
- Handle both approvals and signatures in the same batch

Enabling the feature

Batch approvals & signing is available in **Labs** within your workspace settings. Only workspace owners can enable this feature.

To enable:

Don't see what you're looking for? Log in for the full Help Center experience

 Fireblocks Help C

/

- **Batch Signing:** enable to process signing requests in batches (requires the Batch approvals feature to be enabled first)

Batch approvals can be enabled independently. Batch signing requires Batch approvals to be enabled first.

Adding requests to a batch

Requests must meet these criteria to be added to a batch:

- They must be transfer requests only
- They must arrive from the same workspace
- All requests must be assigned to the same user (cannot mix requests for different users)
- The requests must not be flagged for risk (e.g., malicious activity or other risk levels)
- The feature must be enabled for the workspace the request originates from

Batch size limit: Maximum 10 requests per batch, regardless of type. You can mix approval and signing requests (e.g., 3 approvals and 7 signatures).

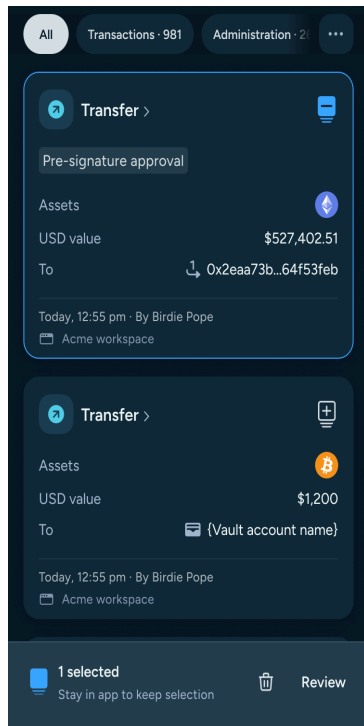

Creating a batch

- **From the request list:**

Don't see what you're looking for? Log in for the full Help Center experience

Fireblocks Fireblocks Help Center

/

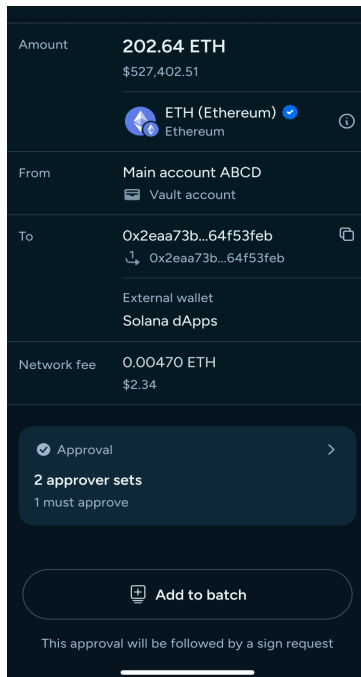

- Tap the icon to add requests to your batch.
- A counter shows how many requests are in your batch (e.g., "5 in batch").
- **From request details:** tap on a request to open the details screen, then tap **Add to Batch**.

 Fireblocks Help Center

/

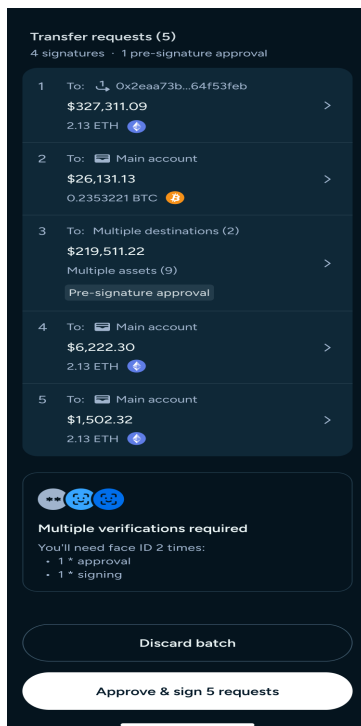

- **Disabled icon:** If the + icon is grayed out, tap it to see why:
 - "Feature not enabled for this workspace"
 - "Can only batch requests for same user"
 - "Batch is full (maximum reached)"

Reviewing your batch

Don't see what you're looking for? Log in for the full Help Center experience

Fireblocks Fireblocks Help Center

/

- **Summary displays:**
 - Number of requests by type (e.g., "1 approval, 5 signing requests")
 - Workspace name (e.g., "Production Workspace")
- **Request list:** tap any request to view full details. Remove requests by swiping left and tapping **Dismiss**, or by opening the request details and selecting **Remove**.
- **Biometric badge:** when your batch contains both approval and signing requests, a "2 biometrics required" badge appears below the request list.

Processing your batch

Use PIN or biometrics to authenticate your batch before it is submitted for processing.

- **Authentication:** enter your PIN once per batch. Biometric authentication depends on your batch type:
 - **Approval-only batch:** one biometric authentication
 - **Signing-only batch:** one biometric authentication
 - **Mixed batch:** two biometric authentications (approval biometric is always first)
- **Canceling**

 Fireblocks Help C

Each request is processed individually. Some requests may succeed while others fail.

Important:

keep the app open during processing. If you background or force-close the app, the batch can fail. Failed transfer requests are no longer valid and must be re-initiated from the Console.

Long processing transfers (v3.5.0 or later)

In the batch review screen, transfers expected to take longer display a **Long processing** tag. Tap the tag to learn more. These are multi-input transfers that require additional processing time. Review these transfers before submitting your batch.

Results

Approval-only batch: when all requests succeed, a full-screen success confirmation appears. Tap **Done** to return to the main view. If you don't tap within 4 seconds, you are automatically redirected.

Signing batch or mixed batch:

- **If all requests succeed:** The same full-screen success confirmation appears with a **Done** button and 4-second auto-redirect.
- **If one or more requests fail:** A results screen appears showing both successful and failed requests. Failed requests appear at the top and include the Fireblocks transaction ID. Use this ID to look up full details in the Console. Failed transfer requests are no longer valid and must be re-initiated from the Console.

Note:

A signed transaction does not guarantee completion. Use the console to track its status.

Tap **Done** to return to the request list. If you don't tap within 4 seconds, you will be automatically redirected. All requests from the batch are removed from your pending list.

 Fireblocks Help C

Batch selection mode

When you have one or more requests in your batch, you cannot approve or deny requests individually. Attempting individual actions displays: "Clear batch to approve individually."

Tap **Discard Batch** to clear all selections and exit batch mode.

Troubleshooting

The "Add to Batch" icon does not appear

Verify you are viewing transfer requests and that requests are not flagged for risk. The feature must be enabled in **Labs**.

The icon is grayed out

Tap the disabled icon to see the specific reason, such as a different workspace or user than your current batch, the feature is not enabled for that workspace, or a batch at maximum capacity.

Can I add requests from different workspaces?

No. All requests in a batch must be from the same workspace and for the same user. The first request you add sets the context for the entire batch.

What happens if I close the app during processing?

Keep the app open during processing. If you force-close the app, the transfers will be terminated and must be re-initiated from the console.

Can I see detailed information about failed requests?

The results screen shows basic information about failed requests along with the transaction ID. Use the transaction ID to look up the full details in the console.

Security

Best practices

1. **Review carefully:** always review your batch before processing to confirm all requests are correct.
2. **Stay in the app:** don't close or background the app while processing.
3. **Group similar requests:** use the filter options in the mobile app (for example, **All requests initiated by me**) to find and group similar requests before building your batch.
