Fireblocks architecture: Introduction

Updated 1 year ago

Overview

The articles in this section aim to set technical expectations during your technical evaluation of the Fireblocks product and identify any change requests and/or professional services required as part of your engagement with Fireblocks.

Intended audience

The articles in this section are intended for:

- Business/product owners to ensure the information aligns with the business goals and objectives.
- Project managers to define tasks for phases and milestones.
- Architects to define the implementation strategy.

Scope

The articles in this section outline Fireblocks' recommended integration and configuration strategy. The articles include references to online documentation you can use as guidance for configuring Fireblocks policies, settings, and developer assistance. They also include a high-level view of the architecture and applicable configurations. These articles do not cover details surrounding any non-Fireblocks-related integrations apart from supported third-party integrations.

Note

The articles in this section are not intended to fully detail the individual integrations. They are used to provide a coarse-grain integration guide. Separate workshops will be held to assist with application-specific configuration and will be documented as needed.
