Mobile authentication methods

Updated 3 years ago

The Fireblocks mobile application is required to sign and authorize transactions and to approve external connections.

Depending on their [role](#), users can whitelist addresses, approve authentication requests, and sign transactions using the Fireblocks mobile application on a [compatible iOS or Android device](#).

Users are required to sign and approve notifications using their device's configured authentication method.

Built-in authentication

Users may configure the Fireblocks mobile application to use the device's built-in fingerprint scanner or facial recognition.

External authentication

Users may configure the Fireblocks mobile application to use [Yubikey](#) for authentication as an alternative to the device's built-in authentication.
