Address Registry

Overview

Address Registry lets you verify the legal entity controlling a blockchain address before sending or receiving a transaction. When enabled, Address Registry allows you to query blockchain addresses and receive certain legal entity information about the institution controlling the associated vault. The Address Registry is designed solely to facilitate counterparty discovery and verification in connection with digital asset transactions.

Address Registry is a free capability available to all Fireblocks customers and enabled by default. Coverage is currently limited to addresses within the Fireblocks network.

Early access

This feature is currently in Early Access (a Beta Service). To request access, enable it in [Settings > Labs](#) or contact your Fireblocks Customer Success Manager. Early Access features are subject to the beta terms under [Product Specific Terms](#).

What Address Registry returns

When you query an address that belongs to an opted-in Fireblocks customer, Address Registry returns:

- **Verification status:** Whether the counterparty's legal entity information has been independently verified (`verified: true`) or is based on Fireblocks data without independent validation (`verified: false`).
- **Legal entity information:** The entity name, jurisdiction (ISO country code), and Legal Entity Identifier (LEI) if the counterparty has declared one. If the counterparty

`not_found`. A `not_found` result does *not* indicate that the address is unhosted, illicit, or non-compliant.

How Address Registry works

Address Registry establishes a trust perimeter across the Fireblocks network. Results are deterministic and consent-based: when Address Registry is active for your workspace, any other opted-in Fireblocks customer can look up one of your vault addresses and receive your legal entity name and jurisdiction. Likewise, you can query any address on the network and receive the same information about the counterparty.

Only workspaces with Address Registry enabled can perform queries. See the [Acceptable use](#) section for more information.

How to look up an address

1. Go to **Policies > Compliance > Address Registry**.
2. Enter a blockchain address in the search bar.
3. View the result.

You can also query addresses programmatically using the API. See the [Address Registry developer documentation](#) for endpoint details and examples.

Legal entity setup

To appear as a verified entity when counterparties look up your addresses, register your Legal Entity Identifier (LEI) with Fireblocks. An LEI is a standardized 20-character code, maintained by the Global Legal Entity Identifier Foundation (GLEIF), that uniquely identifies a legal entity across jurisdictions.

Registering an LEI is optional if you only want to query addresses. It is required to return verified data to counterparties and to use Address Registry in compliance workflows.

Register your LEI via the Console

1. Go to **Policies > Compliance > Address Registry > Add Legal Entity**.
2. Enter your default LEI (a 20-character identifier). You can look it up on the [GLEIF website](#). If you do not have one, Fireblocks helps you obtain one from a partner

Don't see what you're looking for? Log in for the full Help Center experience

You can also register legal entities via the API. See the [Address Registry developer documentation](#) for endpoint details.

LEI states

After you submit an LEI, it moves through the following states:

State	What it means
Pending	Submitted and under Fireblocks review. Your addresses appear as unverified to counterparties during this time.
Approved	Verified by Fireblocks. Queries against your addresses return your legal entity name, jurisdiction, and LEI.
Denied	Rejected by Fireblocks. You can view the reason and resubmit.
Revoked	Previously approved, then revoked due to an expired or invalid LEI.

After Fireblocks approves your first LEI, all vault accounts map to that entity by default. If you register additional legal entities and want to map specific vault accounts to different entities, you can do so via the API.

Opting out of Address Registry

You can opt out your entire workspace or individual vault accounts at any time. When you opt out, lookups against your addresses return `not_found`. Opting out also prevents you from querying addresses or using compliance workflows that depend on Address Registry.

Notes about opting out

- Opting out prevents you from querying addresses or using compliance workflows that depend on Address Registry.

Compliance workflows

Once Address Registry is active, you can use it inside your transaction screening policy to automate compliance decisions based on counterparty identity. This involves two steps: defining counterparty groups, then applying rules to those groups in a screening policy.

Note

Compliance workflows are not yet available but will be added during the Early Access phase.

Counterparty groups

A *counterparty group* is a named set of counterparties that share specific attributes, such as jurisdiction. You can create as many groups as you need. Jurisdiction is the only available grouping attribute initially — additional attributes such as business type and license type are planned.

To create a counterparty group:

1. Go to **Policies > Compliance > Address Registry > Policy > Counterparty Groups > Create Group**.
2. Name the group (for example, "Trusted LATAM Partners" or "Restricted Jurisdictions").
3. Select jurisdictions using the country picker.
4. Select **Save**.

You can also manage counterparty groups via the API. See the [Address Registry developer documentation](#) for endpoint details.

Screening policy

The screening policy has two parts:

- **Transaction screening policy:** Defines which transactions trigger a counterparty check. Build rules using source, destination, asset, and amount. Rules evaluate from top to bottom, and the first match wins. A catch-all default rule is required as the last entry. You also configure timeout behavior separately to define what happens if the registry check times out during a transaction (accept or reject).

 Fireblocks Help Center

Counterparty is in [Group]	Accept or Reject
Counterparty is not in [Group]	Accept or Reject
Address not found in registry	Accept or Reject

Common use cases include allowing payouts only to wallets hosted by verified entities in certain jurisdictions, or blocking transactions to addresses belonging to counterparties in restricted jurisdictions.

Availability and limitations

Fireblocks does not currently support Address Registry for workspaces hosted on European or Swiss environments due to infrastructure isolation between production instances. We plan to add support for these environments shortly after the initial release. In the meantime, queries against addresses from European or Swiss-hosted workspaces return `not_found`.

Address Registry is not available in Developer Sandbox workspaces.

Acceptable use

Address Registry is designed for counterparty verification in connection with digital asset transactions. To maintain the integrity and privacy of the registry, you must use it responsibly. Specifically, you must not:

- Use Address Registry for any purpose other than verifying counterparties in connection with digital asset transactions.
- Scrape, bulk-download, or systematically extract data from the registry.
- Resell, redistribute, or commercialize query results or any data obtained from Address Registry.
- Attempt to identify, profile, or de-anonymize individual persons using Address Registry data.
- Use Address Registry for surveillance or competitive intelligence.
- Circumvent or attempt to circumvent any technical controls, authentication requirements, or rate limits.

FAQ

What is an LEI and why does Address Registry use it?

A Legal Entity Identifier (LEI) is a 20-character global code, mandated by the G20 and maintained by GLEIF, that uniquely identifies a legal entity across jurisdictions. Fireblocks uses LEIs as the verification anchor because they are tied to an independently maintained global standard, rather than a proprietary database.

What does "verified" mean?

Every lookup result includes a `verified` flag:

- `verified: true`: The counterparty declared their LEI, the entity data was sourced from GLEIF, and the Fireblocks compliance team verified that the legal entity name matches Fireblocks client records.
- `verified: false`: The entity data is not based on a declared LEI, and no independent validation should be assumed.

You can filter for verified entities only when building compliance workflows.

What does `not_found` mean?

A `not_found` result means one of the following: Address Registry is not yet available in the counterparty's region, the counterparty has opted out, or the counterparty is not a Fireblocks customer. It does *not* indicate that the address is unhosted, illicit, or non-compliant.

How does Address Registry relate to Travel Rule requirements?

FATF guidance (paragraph 197) outlines three steps for counterparty identification:

1. Determine whether you are transacting with a VASP or an unhosted wallet.
2. Identify the counterparty VASP using a reliable data source. Address Registry provides a deterministic source that Fireblocks updates in real time.
3. Assess whether the counterparty VASP is eligible to receive customer data. Verified GLEIF data can serve as a first filter.

Address Registry also surfaces which Travel Rule provider the counterparty uses, if declared.

address controlled by Acme Payments Ltd., Brazil; they see "Acme Payments Ltd., Brazil", not any information about Acme's customers which may own the funds. The registry contains no information about a client's individual account holders.

How does Address Registry differ from blockchain analytics?

Blockchain analytics firms use heuristics to link addresses to entities and beneficial owners, typically without explicit consent. Address Registry operates on institutional consent, is deterministic, and is scoped to a single purpose: counterparty discovery for compliance and security.

What stops someone from scraping the registry?

Address Registry is privacy-preserving by design. You can only look up a specific address to retrieve the controlling entity; you cannot query in reverse or enumerate the registry. Fireblocks enforces query authentication, API rate limiting, daily request caps, and monitoring alerts to keep the number of queries proportional to transaction volume.

Will Fireblocks sell my query data?

No. Fireblocks does not sell Address Registry query results or usage data.

What are the implications under GDPR?

The Address Registry is designed to return attribution at the legal entity level and does not intentionally contain information about individual account holders or end users. Fireblocks does not maintain any direct linkage within the Address Registry between vault addresses and identified natural persons. Participants should conduct their own assessment of applicable data protection obligations with respect to their participation in the Address Registry.
