Build a custom Deposit Control and Confirmation Policy

Updated 8 months ago

Overview

You can override the default Deposit Control and Confirmation Policy (DCCP) by creating a custom confirmation policy.

First, [download the DCCP template](#), then modify it according to your organization's business needs and risk models. For example:

- You can enter zero or a small number for faster confirmations for known and trusted sources.
- You can enter a higher number to help mitigate risks for unknown or untrusted sources.

Remember that [Fireblocks restricts the number of confirmations allowed for certain blockchain networks](#).

After you're done, [submit your policy template to Fireblocks Support](#) for review, approval, and implementation.

Rule parameters

The DCCP operates on a first-match basis rule set using the following parameters:

Parameter	Description
Source	This parameter defines the type of venue from which the transaction originates. This can be specific, such as a vault account; groups of accounts, such as all your Binance accounts; or general, such as all exchanges, all Fireblocks P2P Network connections, and so on.

 Fireblocks Help Center

Amount	This parameter defines the minimum or maximum amount a transaction must be before the rule applies. This parameter can be set to: • An asset's USD equivalent at the time of the transaction • A specific asset's quantity • "Any" - includes all transactions that match all other rule parameters
Asset	This parameter defines the type of asset sent in a transaction. This parameter can be set to a specific asset or to include any asset supported by Fireblocks. Asset can be set to Any. However, when you list a specific asset, you must also specify the blockchain for that asset. Asset can be listed in one of the following formats: • Asset ID retrieved via the Supported Assets Fireblocks API endpoint • Contract address • Asset symbol with blockchain specified separately • Asset name with blockchain specified separately Many assets have similar symbols and names. The asset ID or contract address is recommended if your confirmation policy includes different rules for many specific assets.
Blockchain network	This parameter defines the blockchain network where any specified asset is transferred. For example, you must specify whether a rule applies to USDC transactions on Avalanche or Ethereum. You can only enter blockchain networks currently supported by Fireblocks in this field, including testnet blockchain networks.
# of Confirmations	This parameter defines the number of confirmations required for a transaction to clear and for funds to be credited to a wallet.

/

minimum number of confirmations for the respective blockchain.

For example, you may set all vault-to-vault transactions for any asset on any blockchain to the minimum number of confirmations. Then all vault-to-vault BTC transactions will move to complete after 0 confirmations, while transactions of any asset on Polygon will complete after 1 confirmation.

Rule examples

The table below contains some generic examples of DCCP rules. It takes a few of the recommended confirmation numbers above and applies them to the policy template, along with a brief explanation of each rule below the table.

Rule #	Source	Destination	Amount	Asset	Blockchain Network	# of Confirmations
1	Any	Any	Any	ETC	Ethereum Classic	500
2	Vault	Vault	Any	Any	Any	Minimum
3	Coinbase Exchange	Vault	Any	Any	Litecoin	Minimum
4	Any	Vault	10K	BTC	Bitcoin	6
5	Any	Vault	Any	BTC	Bitcoin	3
6	Any	Vault	Any	USDC	Avalanche	7
7	Any	Vault	Any	USDC	Ethereum	6
8	Any	Any	Any	Any	Any	1

1. Incoming and outgoing ETH transactions of any amount on the Ethereum Classic blockchain network require 500 confirmations. Ethereum Classic is subject to a 51% attack risk, so we recommend many confirmations.

policy, all incoming and outgoing transactions require the minimum number of confirmations, which is 6.

4. Incoming and outgoing BTC transactions above \$10,000 on the Bitcoin blockchain network require 6 confirmations.
5. Incoming and outgoing BTC transactions up to \$10,000 on the Bitcoin blockchain network require 3 confirmations.
6. Incoming and outgoing USDC transactions of any amount on the Avalanche blockchain network require 7 confirmations.
7. Incoming and outgoing USDC transactions of any amount on the Ethereum blockchain network require 6 confirmations.
8. Incoming and outgoing transactions from any source to any destination in your Vault of any amount on any blockchain network require 1 confirmation.
