AML: Overview

Customer Reference ID

Note

The AML integration is a premium feature that requires an additional purchase. Reach out to [your Customer Success Manager](#) if you do not have an agreement with an AML provider or you need help enabling the feature.

Overview

You can automatically associate users with incoming and outgoing transactions by assigning a Customer Reference ID with the Fireblocks API. Providing this information to your Anti-Money Laundering (AML) provider lets you view the potential risk of transacting with each user. It also helps with compliance and AML investigations by making connections between transactions and identifying illegal patterns and behavior.

A transaction that touches a deposit address or vault account with a Customer Reference ID is automatically associated with that Customer Reference ID. Additionally, setting a Customer Reference ID of a SegWit address updates the Legacy address and vice versa.

Customer Reference IDs can be helpful when differentiating transaction screenings from multiple workspaces, vault accounts, asset wallets, and transactions.

Incoming transactions

For incoming transactions, you can set the Customer Reference ID for the following:

- A specific deposit address, using the [Assign AML customer reference ID](#) endpoint
- A specific destination vault account, using the [Set an AML/KYT customer reference ID for a vault account](#) endpoint

Outgoing transactions

For outgoing transactions, you can set the Customer Reference ID for the following:

- When you use the [Create a new transaction](#) endpoint
- A specific internal wallet address, using the [Set an AML/KYT customer reference ID for an internal wallet](#) endpoint
- A specific external wallet address, using the [Set an AML customer reference ID for an external wallet](#) endpoint
- A specific source vault account, using the [Set an AML/KYT customer reference ID for a vault account](#) endpoint

Supported characters

Customer Reference IDs can be up to 200 characters. You can use the following characters:

- a-z
- A-Z
- 0-9
- Dash (-)
- Underscore (_)
- Colon (:

What happens when Customer Reference IDs overlap?

A fixed order determines the Customer Reference ID when Customer Reference IDs overlap.

- **Incoming transactions:** Deposit addresses override destination vault accounts.
- **Outgoing transactions:** Transactions override destination wallets, and destination wallets override source vault accounts.
