Vault account balances

Updated 6 months ago

Overview

Fireblocks shows the total balance of all vault accounts on your accounts page. When viewing individual accounts, Fireblocks shows the available balance of each asset wallet.

Asset wallets that support multiple deposit addresses, including UTXO-based assets and assets that support tags or memos, display the aggregated balance.

Vault account balances

Multiple-address balances

For some blockchains, Fireblocks supports the option to generate multiple deposit addresses for the same asset wallet. Refer to the [deposit addresses article](#) to determine which blockchains Fireblocks supports the multiple deposit addresses option. In these cases, Fireblocks displays the accumulated balance of all these addresses.

If you wish to check the balance of a specific deposit address, use the [Get UTXO unspent inputs information](#) endpoint.

Inflow

The inflow balance displays incoming transactions to your Vault that still need to be confirmed. When a transaction appears in inflow, it can then be frozen according to your Anti-Money Laundering (AML) policy. If your AML policy does not freeze the transaction, the transaction amount is added to the available balance after the transaction is confirmed according to your [Deposit Control & Confirmation Policy](#).

If the transaction fails, the amount is removed from your balance. [Learn more about transaction statuses](#).

Outflow

Don't see what you're looking for? Log in for the full Help Center experience

 Fireblocks Fireblocks Help C

/

If the transaction fails, the amount returns to its source. [Learn more about outgoing transaction statuses.](#)

Frozen

If your workspace has an AML policy, incoming transactions may be automatically frozen according to the policy. Transactions can also be manually frozen via the API. The amount of funds from all frozen transactions is shown here.

Total

The total available amount held in all displayed vault accounts, including inflow, outflow, and frozen funds.

Refreshing balances

Vault account balances are updated automatically for:

- **Outgoing transactions:** After the transaction is approved.
- **Incoming transactions:** After a recognized transaction is confirmed on the blockchain according to your workspace confirmation policy. Most blockchain networks require one confirmation by default. [Learn more about the Deposit Control & Confirmation Policy.](#)

Select **Refresh balance**  when viewing a vault account to refresh all listed asset wallet balances, including all deposit addresses for UTXO-based wallets.

You can also use the [Fireblocks API](#) to refresh a specific vault account asset balance.

Export file types

Vault account balances, deposit addresses, address balances, and [Hierarchical Deterministic \(HD\) paths](#) can be exported as two separate CSV files.
