Adding non-EVM assets to a workspace

Updated 23 days ago

Overview

Fireblocks supports certain non-EVM assets across all Fireblocks workspaces. In addition to these globally supported assets, Owners, Admins, Non-Signing Admins, Signers, and Editors can manually add more non-EVM assets to your organization's workspace as needed.

What standards are supported?

You can list additional assets on these non-EVM blockchains:

- Algorand (ASA)
- Canton (CIP-56)
- Digital Bits (XDB)
- Hedera (ERC-20)
- NEAR (NEP-141)
- Ripple (XRPL)
- Solana (SPL)
- Solana 2022 tokens
- Stellar
- Sui
- Tezos (FA1.2, FA2)
- TON
- TRON (TRC-20)

Some blockchains require a minimum balance or manual confirmation when adding asset wallets. Learn more about asset wallets on [Algorand](#), [Solana](#), [Stellar](#), and [Ripple](#).

these methods:

- Via the Fireblocks Console
- Via the Fireblocks API
- Via Fireblocks Support

Via the Fireblocks Console

You can use the Fireblocks Console to add non-EVM assets on the Algorand, NEAR, Solana, Stellar, and TRON blockchains.

1. Go to the Assets page and search for the asset in the top left corner. If the asset is not listed, select **List asset**. This button also appears when attempting to create a wallet for assets not currently listed in the workspace.
2. Select the asset's blockchain, and select **Continue**.
3. Copy and paste the asset's contract address and name (if required). You can find this information using a block explorer for the asset's blockchain network.
4. Select **Continue**. Fireblocks verifies the contract address and blockchain and then displays the asset's properties.
5. Select **List asset** to list the asset in your workspace. You can now add asset wallets for this asset to any vault account.

We couldn't find any results for "solcex"

The asset may not be listed in the workspace.

[List asset](#)

Via the Fireblocks API

Use the [Register an asset](#) endpoint to add non-EVM assets on the Algorand, NEAR, Solana, Stellar, Sui, and TRON blockchains. This makes the asset available via the Fireblocks API for all asset-related operations, such as:

- Creating asset wallets for this asset in any vault account
- Whitelisting addresses for this asset in any whitelisted wallet
- Creating transactions with this asset
- Tracking active transactions with this asset
- Viewing previous transactions with this asset
- Retrieving vault accounts, exchange accounts, and whitelisted wallets that contain this asset

Via Fireblocks Support

[Contact Fireblocks Support](#) to add an unlisted asset on one of these blockchains to your workspace. You must provide a link to the token's page from the relevant block explorer:

- [DigitalBits](#)
- [Hedera \(ERC-20\)](#)
- [XRPL \(Ripple\)](#)
- [Tezos](#)

Depending on the token requested, Fireblocks may make the token available to all Fireblocks customers or only to your workspaces.

transfer of their base asset, except Terra Classic. Fireblocks support for Terra Classic only includes LUNC, USTC, KRTC, MNTC, and SDRC.

You can also submit requests for Fireblocks to support asset listing for non-EVM blockchains not currently supported by the feature. When attempting to list a new non-EVM asset in the Fireblocks Console, select **Vote to support** corresponding to the blockchain that's not supported for asset listing. You can vote for as many blockchains as you want.

Adding Solana 2022 Tokens to a Workspace

Fireblocks supports both **SPL tokens** and the new **Solana Token2022** standard. The Token2022 standard introduces additional capabilities known as **Token Extensions** (for more information, see the [Solana Documentation on Token 2022 Extensions](#)). Note that Fireblocks' level of support for these extensions varies.

Important Warnings for Solana 2022 Tokens

- **Interest Bearing:** Solana provides [a utility function](#) to help you view your accumulated balance, which may differ from the balance shown in Fireblocks.
- **Memo Transfer:**
If you perform a transfer via Fireblocks and add a note, it will not be included as a memo instruction, which may cause the transfer to fail if the asset requires a memo. To ensure successful transfers, use Solana program calls directly when memo functionality is needed.
- **Non-Transferable:** Transfers will fail if this extension is enabled. Always verify token properties before initiating a transfer.
- **Confidential Transfers / Transfer Fee:**
Solana's hidden balance and transfer mechanisms used by confidential transfers are currently not supported by Fireblocks. Regular transfers are supported, but you must use the Fireblocks Program Call API to view and use hidden balances.
- **Default Account State:**
Tokens may be received in a frozen state by default. Holders must confirm the token is unfrozen before attempting transfers.

details, including the asset's ID in the Fireblocks API and its contract address. Use the asset's ID in Fireblocks for all relevant API endpoints.

To find the new asset via the API, use the [Get supported assets](#) endpoint, then look for the asset by **name**, **contractAddress**, or **id**.

Troubleshooting

- Make sure the asset you're listing contains metadata. Otherwise, you may be unable to list the asset. You can check the asset's metadata using a block explorer.
- Incoming transactions involving assets deposited to your vault account before being added to your workspace do not appear in your Transaction History. However, the destination account balance will include the asset. [Contact Fireblocks Support](#) to re-scan the deposit address and recognize the incoming transaction.
