# Best practices for transaction reconciliation and crediting

Updated 5 months ago

You can create an automated mechanism that notifies your organization or clients about incoming transactions using the following methods:

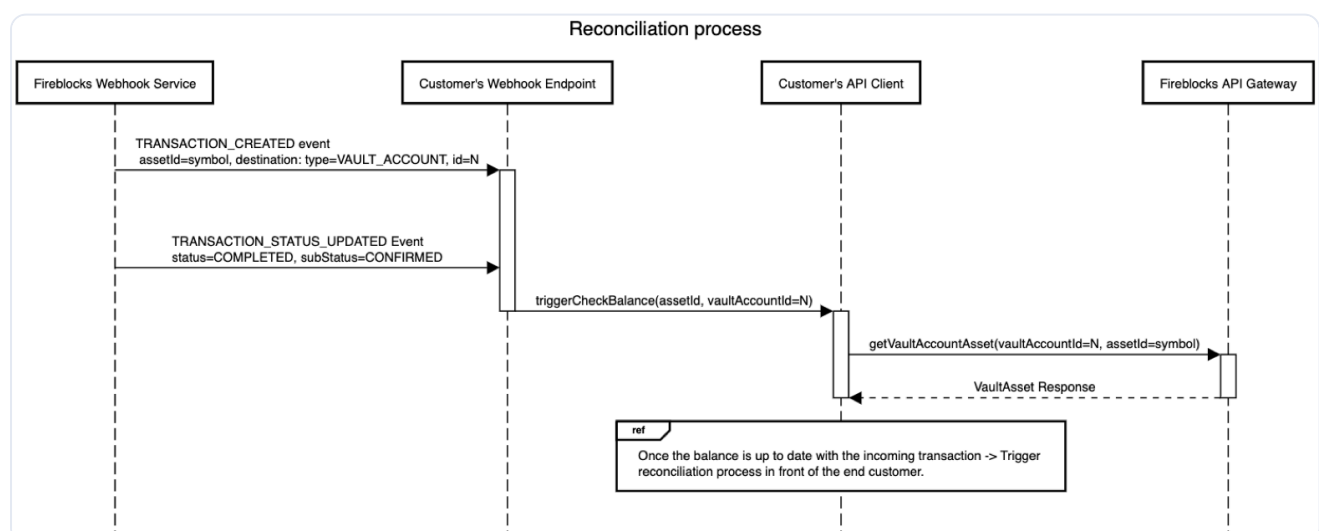

- [Webhook notifications](#)
- [Pulling the transaction history log using the Fireblocks API](#)

When you monitor notifications using one of the above methods, you should only consider incoming transactions for reconciliation after you receive a notification that the incoming transaction's status has been updated to **Completed**. Depending on the asset type, this status update occurs at different times:

- For UTXO-based assets, Fireblocks sends a notification when the transaction is present in the mempool.
- For account-based assets, Fireblocks sends a notification when the transaction is mined.

**IMPORTANT:** After verifying the transaction's status, check the wallet's balance using the Fireblocks API to verify the deposit is included.

Below is a sequence diagram for additional reference:
