Creating new transfers

Updated 7 months ago

Overview

You can create a new transfer in the Fireblocks Console to send funds to counterparties or between accounts you control. New transfers in Fireblocks are limited by [Policies](#) and [user role](#).

You can open the New Transfer dialog from many places throughout the Fireblocks Console. Depending on where you open it, different fields may be pre-populated.

Transfer

Note that Policies govern all new transfers created in your Fireblocks Console except for certain [third-party account transactions](#).

Navigation panel

To initiate a new transfer with no pre-selected details, select **+ Transfer** in the top-left corner of the Console.

Withdraw button

You can withdraw from any vault, exchange, or fiat account you control to transfer funds to any available vault account, connected exchange, fiat account, Fireblocks P2P Network

 Fireblocks Fireblocks Help C

- When you select **Withdraw**  on the Accounts page, the New Transfer dialog appears with the associated account in the **From** field.
- When you select **Withdraw**  on the Assets page or in an asset wallet, the New Transfer dialog appears with the associated asset in the **Asset** field and the associated account in the **From** field.
- When you select **Withdraw**  on the NFTs page, the New Transfer dialog appears with the selected NFT in the **Asset** field and the selected account in the **From** field.

Deposit button

You can deposit to any vault account, exchange account, fiat account, Fireblocks P2P Network connection, or whitelisted address in your workspace.

Select **Deposit**  to initiate deposits to a destination in your workspace.

- When you select **Deposit**  on the Accounts, Fireblocks P2P Network, or Whitelisted Addresses pages, the New Transfer dialog appears with the associated account in the **To** field.
- When you select **Deposit**  on the Assets page or in an asset wallet, the New Transfer dialog appears with the associated asset in the **Asset** field and the associated account in the **To** field.

New transfers

Open the New Transfer dialog using any of the methods described above and complete its fields. You can edit all fields regardless of where you opened it. The dialog updates dynamically depending on the selected asset, source, and destination.

After you select **Create Transfer**:

- The transaction appears on the Recent activity panel and in your workspace's Transaction History.
- If applicable due to a Policy rule, all designated approvers receive a notification to approve the transaction. It must be approved within two hours of creation.

After the transaction is signed, you can view the transaction details for more detailed information.

New Transfer dialog fields

Field name	Description
Asset	Select any asset or non-fungible tokens (NFT) available in your workspace. Wallets with no balance appear but can't be selected.
From	The account from which you want to transfer the selected asset. Use the list's tabs to filter the list by type.
To	The account, Fireblocks P2P Network connection, whitelisted address, or one-time address to which you want to transfer the selected asset. Use the list's tabs to filter the list by type.
Net Amount/Total Amount (Net/Gross)	The amount of the asset you want to transfer. Select Net to exclude the transaction fee from the amount transferred, or select Gross to have the transaction fee deducted from the transferred amount.
USD	Only available in the Fireblocks Console. Select this checkbox to switch the Net Amount/Total Amount field to use the United States Dollars (USD) value of the specified asset instead of asset quantity. The final asset amount transferred may vary based on fluctuations in the asset's monetary value. Additionally, due to these fluctuations, the asset quantity transferred will appear on the Transaction History, not the USD amount.
Max	Select this checkbox to transfer the full available amount of the selected asset. This uses the gross transaction fee by default. For UTXO-based assets, the maximum amount per transaction may be lower than the total available balance.

workspace and is not sent to the blockchain.

Fireblocks P2P Network transfers

On the Fireblocks P2P Network, you can [connect directly with counterparties](#), not wallets, giving you greater efficiency and ease of transacting.

Simultaneous multiple transfer limitations

Performing multiple withdrawals of funds from a single vault account is only limited by the blockchain's nonce implementation, and not by any rate limit. Any transaction remains in Queue status until the previous transaction is signed. Depending on your Policy setup, a co-signer can sign your additional new transactions to expedite the process, but they still need to be sent out one by one. If, for instance, the limit for creating new transactions is 20 per minute, it means you can only create 20 transactions within a minute.

If you attempt to submit another "create transaction" request within that minute, such an attempt will fail, and result in an Error 429 - rate limit notice. See [here](#) for more information on rate limits. However, the nonce queue can be unlimited, as it depends on the speed of the cosigner machine, or on manual signing by mobile devices. Therefore, you may have 20, 200, or even 2000 transactions in the queue.

If you are transferring funds using multiple vault accounts, our rate limit is the limiting factor. In this scenario, the blockchain's nonce is not triggered.

Blockchain warning for assets

Irregular blockchain activity is highlighted in the New Transfer dialog when interacting with affected assets.

There are two status notifications:

- **Network warning** - The blockchain network performance is degraded, and transactions are taking a long time to process. incoming transactions may be delayed or not appear. Outgoing transactions may take longer than expected.

request early access to your workspace.

Blockchain or node infrastructure is down

If a blockchain is currently down, you can not submit new transactions with any assets on that blockchain until it is available again. Withdraw and deposit buttons are disabled for all relevant assets, and a warning is displayed when selecting an asset in the new transfer window.

The New Transfer window displays a warning if the selected asset is affected.
