EOS transaction fees (PowerUP model)

Updated 1 month ago

Overview

The EOS community has deployed a new resource allocation model called the [EOS PowerUp Model](#).

EOS PowerUp Model on Fireblocks

CPU & NET

With the EOS PowerUp Model, an account can pay a small network fee to power up the account with CPU and NET bandwidth for 24 hours that can be used to fulfill the account's transaction needs.

RAM

Each new EOS account on Fireblocks is created with a predefined amount of RAM payed for by Fireblocks. Every PowerUp uses some of this spare RAM. The RAM bought for the account may run out if an account is powered up several times. In this case, Fireblocks will PowerUp and automatically purchase additional RAM for the account.

Transaction fees

On the Fireblocks platform, Fireblocks embeds the periodic PowerUp operation and RAM purchase in the transaction fee. When a user creates a new transaction, the displayed "Estimated Fee" is the maximum fee that is possible. In case extra RAM is needed, the "Estimated Fee" will be higher and will include the amount necessary to purchase more RAM.

/

account can't execute a PowerUp operation to rent temporary CPU and can't perform any other transaction to recover resources on its own. Effectively, the account is stuck.

What causes CPU depletion

Several factors can drain an account's CPU allocation:

- High transaction volume that consumes all available CPU bandwidth
- Smart contract interactions with significant computational requirements
- Batch operations or automated processes running against the account
- Network congestion during peak periods, which amplifies CPU costs
- Unstaking CPU without keeping a minimum reserve
- A delegator withdrawing CPU that was staked on your behalf

How to avoid getting stuck

Monitor your resource usage through an EOS block explorer and always keep a small CPU reserve. Maintaining at least 0.000001 EOS worth of CPU prevents the account from hitting zero and becoming unable to self-recover.
