Embedded Wallets Takeover Option

Updated 2 years ago

Embedded Wallets Takeover option

The Fireblocks Embedded Wallets (EW) solution allows Fireblocks customers to offer wallets to their end users, without being exposed to managing key material on the customer premise, but rather on the end-user device, granting the end users full control over their assets. Learn more [here](#).

The **Embedded Wallets Takeover** feature is a significant part of the non-custodial offering. It allows end users to receive their full cryptographic keys, providing them with the autonomy to move their assets to a different wallet. In enabling this feature, the end user's wallet within the Customer's environment continues to operate as usual. However, Fireblocks and the customer are unable to guarantee the end user's wallet security since the private key that the end user holds creates a significant security threat.

The **Takeover** feature is optional, and the customer can decide whether to activate it or not. After activation, the customer can reverse the decision and deactivate the option. Enabling and disabling the feature is done by [opening a support ticket](#) to the Fireblocks Support Team.
