Globally supported assets

Updated 4 months ago

Overview

Fireblocks supports thousands of assets across dozens of supported blockchain networks, observes trends in the blockchain world, and frequently adds global support for new assets. All supported assets have the same name and asset ID across all customer workspaces where they are available.

- Globally supported assets are available by default when creating new asset wallets in any Fireblocks workspace.
- Locally supported assets only appear in Fireblocks workspaces that have been manually added or requested. They are available to transfer to any destination that supports them. You should always confirm that a counterparty supports an asset before transferring local assets to a Fireblocks P2P Network destination.

Token support

Ethereum and EVM tokens

Tokens are supported in the following formats on Ethereum and all EVM blockchains.

For most newly supported assets see [Blockchain data sheets on Fireblocks](#).

ERC-20

This includes all similar token standards listed below on all supported EVM blockchains in the Fireblocks Console and API.

- OG: ERC-20
- Abstract (ETH)
- Aevo: ERC-20
- Aleph Zero: ERC-20
- Apechain: ERC-20
