Solana program call API

Note

Solana program calls require a hot wallet and cannot be used in cold workspaces.

Overview

The Fireblocks API lets you initiate special transactions that interact directly with Solana programs. Calling a Solana program with our API allows you to initiate and sign a PROGRAM_CALL operation that includes details and clarity about the transaction.

Program call data is [decoded](#) for greater transparency, allowing you to monitor the transaction's status using the Fireblocks Console or API. The status will be updated in real time to reflect its progress.

Creating a program call transaction on Solana

If you already use the [@solana/web3.js](#) library, you can use our [Solana Web3 Adapter](#) to simplify transaction sending.

Alternatively, you can call the [Create a new transaction](#) endpoint directly with the following parameters:

- **Operation:** Set to PROGRAM_CALL
- **Source:** The vault account ID from which the transaction is initiated
- **Asset:** SOL or SOL_TEST
- **Data Payload:** Pass the data payload as the ProgramCallData field under extraParameters
