Typed Message Signing

Overview

Typed message signing allows you to sign a message using standard formats prefixed with a specific string. Typed messages alone don't constitute a transaction but are often involved during the transaction signing process. They're typically sent by Web3 dApps, and the approval notification in the Fireblocks mobile app displays a readable message. This signing method is safer than (and preferred over) Raw Signing because it helps mitigate the risk of users signing a valid but malicious transaction.

We support the following Typed Message formats:

- **Bitcoin personal message:** Used for Proof-of-Address ownership. This format can be used with the [TRUST](#) platform to assist with Travel Rule compliance.
- **Ethereum personal message (ETH_MESSAGE):** Primarily used for off-chain messages triggered by DeFi platforms, meta transactions, and Proof-of-Address ownership. This format can be used with the [TRUST](#) platform to assist with Travel Rule compliance.
- **EIP-712 typed structured data (EIP-712):** Similar to Ethereum personal message but uses a slightly more structured message format that provides more security.

Enabling Typed Message Signing

To use a dApp that requires you to sign in a Typed Message format, [create a Typed Message Policy rule](#) for that smart contract.

Using Typed Message Signing
